## Symmetric functions and Schur functions

- Convention:  $h_0 = 1$  and  $h_d = 0$  for  $d < 0$ .
- For any  $\gamma = (\gamma_1, \dots, \gamma_n) \in \mathbb{Z}^n$ ,

$$s_\gamma = s_\gamma(X) = \det(h_{\gamma_i+j-i}(X))_{1 \leq i,j \leq n}$$

$$s_\gamma = s_\gamma(X) = \det(h_{\gamma_i+j-i}(X))_{1 \leq i,j \leq n}$$

Then, for  $\rho = (n-1, n-2, \dots, 1, 0)$ ,

$$s_\gamma = \begin{cases} \operatorname{sgn}(\gamma + \rho) s_{\operatorname{sort}(\gamma+\rho)-\rho} & \text{if } \gamma + \rho \text{ has distinct nonnegative parts,} \\ 0 & \text{otherwise,} \end{cases}$$

- $\operatorname{sort}(\beta) =$  weakly decreasing sequence obtained by sorting  $\beta$ ,
- $\operatorname{sgn}(\beta) =$  sign of the shortest permutation taking  $\beta$  to  $\operatorname{sort}(\beta)$ .

## Hidden Guide: Schur Positivity

“Naturally occurring” symmetric functions which are non-negative (coefficients in  $\mathbb{N}[q, t]$ ) linear combinations in Schur polynomial basis are interesting since they could have representation-theoretic models.

$$\tilde{H}_\mu^{(s)} := \omega \sigma \left( (z_1 \cdots z_n)^s \frac{\prod_{\alpha_{ij} \in R_\mu \setminus \widehat{R}_\mu} (1 - q^{\text{arm}(b_i)+1} t^{-\text{leg}(b_i)} z_i / z_j) \prod_{\alpha \in \widehat{R}_\mu} (1 - qt z^\alpha)}{\prod_{\alpha \in R_+} (1 - q z^\alpha) \prod_{\alpha \in R_\mu} (1 - t z^\alpha)} \right)$$

## Conjecture (Blasiak-Haiman-Morse-Pun-S.)

For any partition  $\mu$  and positive integer  $s$ , the symmetric function  $\tilde{H}_\mu^{(s)}$  is Schur positive. That is, the coefficients in

$$\tilde{H}_\mu^{(s)} = \sum_{\nu} K_{\nu,\mu}^{(s)}(q, t) s_\nu(X)$$

satisfy  $K_{\nu,\mu}^{(s)}(q, t) \in \mathbb{N}[q, t]$ .

# Catalanimals in the shuffle algebra

For  $\lambda \in \mathbb{Z}^n$ ,

$$\begin{aligned}\sigma_{\Gamma}^n(\mathbf{z}^{\lambda}) &= \sum_{w \in S_n} w \left( \frac{\mathbf{z}^{\lambda} \prod_{\alpha \in R_+} (1 - qtz^{\alpha})}{\prod_{\alpha \in R_+} ((1 - z^{-\alpha})(1 - qz^{\alpha})(1 - tz^{\alpha}))} \right) \\ &= H(R_+, R_+, R_+, \lambda) \in \mathcal{S}_{\Gamma}.\end{aligned}$$

- Technicality: we have redefined

$$\sigma(\mathbf{z}^{\gamma}) = \sum_{w \in S_n} \left( \frac{\mathbf{z}^{\gamma}}{\prod_{\alpha \in R_+} (1 - z^{-\alpha})} \right) = \chi_{\gamma}, \text{ the irreducible } \mathrm{GL}_n \text{ character.}$$

- Let  $\mathrm{pol}_X$  send  $\chi_{\lambda} \mapsto s_{\lambda}$  if  $\lambda_n \geq 0$ , otherwise  $\chi_{\lambda} \mapsto 0$ .
- The  $\sigma$  from before is given by  $\sigma_{\mathrm{old}} = \mathrm{pol}_X \sigma_{\mathrm{new}}$ .

# Catalanimals in the Shuffle algebra

$\sigma_{\Gamma}^n(f)$  can lie in  $\mathcal{S}_{\Gamma}$  even when  $f$  is not a Laurent polynomial.

## Theorem (Negut)

*The following family of Catalanimals lie in the shuffle algebra:*

$$\sigma_{\Gamma}^n \left( \frac{\mathbf{z}^{\lambda}}{\prod_{i=1}^{n-1} (1 - qtz_i/z_{i+1})} \right) = H(R_+, R_+, R'_+, \lambda) \in \mathcal{S}_{\Gamma},$$

where  $R'_+ = \{\alpha_{ij} \in R_+ \mid i + 1 < j\}$ .

# The wheel condition

- A symmetric Laurent polynomial  $g(z)$  satisfies the *wheel condition* if it vanishes whenever any three of the variables  $z_i, z_j, z_k$  are in the ratio  $(z_i : z_j : z_k) = (1 : q : qt) = (1 : t : qt)$ .
- Let  $\mathcal{S}_{\check{\Gamma}} \cong \mathcal{S}_\Gamma$  for  
 $\check{\Gamma}(z_i, z_j) = (1 - z_i/z_j)(1 - qz_j/z_i)(1 - tz_j/z_i)(1 - qtz_i/z_j)$ .

## Theorem (Negut)

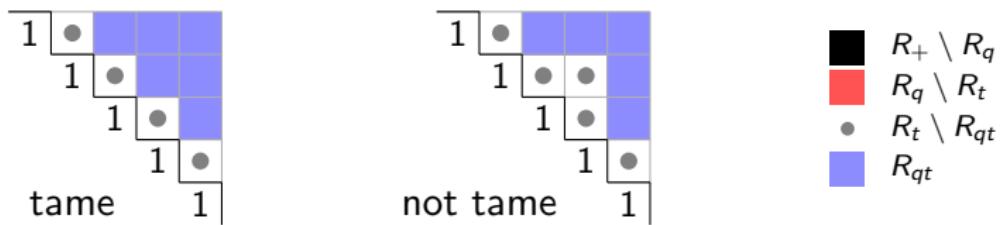

A symmetric Laurent polynomial  $g(z_1, \dots, z_n)$  belongs to  $\mathcal{S}_{\check{\Gamma}}$  if and only if it satisfies the wheel condition and vanishes whenever  $z_i = z_j$  for  $i \neq j$ .

# The wheel condition and tame Catalanimals

A Catalanimal  $H(R_q, R_t, R_{qt}, \lambda)$  is *tame* if

$$R_q + R_t \subseteq R_{qt},$$

where  $R_q + R_t = \{\alpha + \beta \mid \alpha \in R_q, \beta \in R_t\}$ .

The Catalanimals  $H(R_+, R_+, R'_+, \lambda)$  and the LLT Catalanimals are tame.

Using Negut's theorem, we show: Tame Catalanimals belong to the shuffle algebra  $\mathcal{S}_\Gamma$ .
