Overview

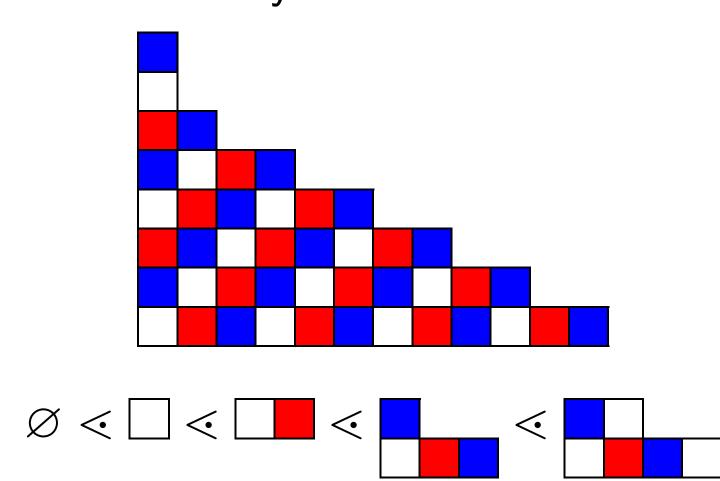

- Schur functions, s_{λ} , and Grothendieck polynomials, G_{λ} , give representatives for cohomology and K-theory of the Grassmannian.
- Pieri rules determine the structure constants of these rings.
- Representatives are known for (co)homology of affine Grassmannian.
- Aim: develop similar picture for affine K-theory.

Affine Combinatorics

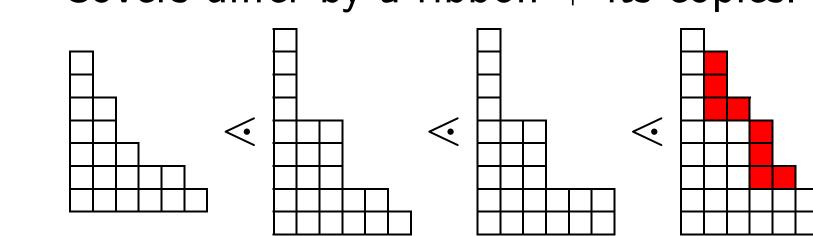

Weak Order

Covers differ by boxes of same color.

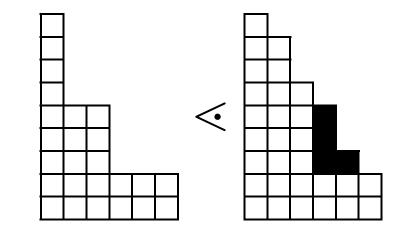

Strong (Bruhat) Order

- Ordered by containment of shapes.
- Covers differ by a ribbon + its copies.

 Marked Cover: Strong cover with selection of one ribbon

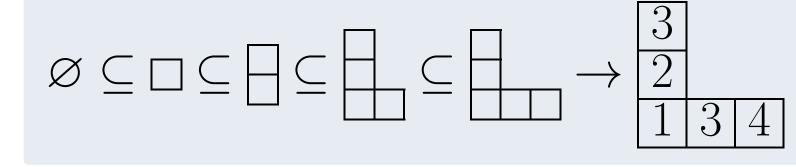

Dual *k*-Schur Functions

Generating functions of weak tableaux.

$$F_{\lambda}^{(k)} := \sum x^{\operatorname{weight}(T)}$$

Weak Tableaux:

Maximal chains in the weak order.

Pieri Rule:

$$e_r F_{\lambda}^{(k)} = \sum_{\mu = \lambda + \text{ strong marked vertical strip of size } r} F_{\mu}^{(k)} \iff e_r^{\perp} s_{\mu}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r} s_{\lambda}^{(k)} = \sum_{\lambda = \mu - \text{ strong marked vertical strip of size } r$$

where a strong vertical strip is a chain of marked covers with markings proceeding north to south.

Affine Grothendieck **Polynomials**

Generating functions of affine SVTs.

$$G_{\lambda}^{(k)} := \sum_{j=1}^{k} (-1)^{|\lambda|+|\operatorname{weight}(T)|} x^{\operatorname{weight}(T)}$$

Affine Set-Valued Tableaux:

Each $T_{\leq x}$ is a k+1-core.

$$T = \begin{bmatrix} 7 \\ 2,5 & 6 \\ 1 & 2,3 & 4 & 4,6 \end{bmatrix} \quad T_{\leq 4} = \begin{bmatrix} 2 \\ 1 & 2,3 & 4 & 4 \end{bmatrix}$$

- $G_{\lambda}^{(k)} = F_{\lambda}^{(k)} + \text{ higher order terms}$
- $G_{\lambda}^{(k)} = G_{\lambda}$ for large k.

Dual Affine Grothendieck Polynomials

k-Schur Functions

Generating functions of strong tabelaux.

 $s_{\lambda}^{(k)} := \sum x^{\operatorname{weight}(T)}$

Strong Tableaux: Maximal strong

 $\varnothing \subseteq \blacksquare \subseteq \blacksquare \hookrightarrow \boxed{\frac{3}{2}}$ 1 3

order chains of marked covers

 $\varnothing\subseteq\blacksquare\subseteq\blacksquare\subseteq\blacksquare$

 $\varnothing\subseteq\blacksquare\subseteq\blacksquare\subseteq\blacksquare$

 $g_{\lambda}^{(k)}$ is dual basis to $G_{\lambda}^{(k)}$.

- $g_{\lambda}^{(k)} = s_{\lambda}^{(k)} +$ lower order terms
- $g_{\lambda}^{(k)} = g_{\lambda}$, dual to G_{λ} , for large k.

Open Problem

Find a direct definition of $g_{\lambda}^{(k)}$.

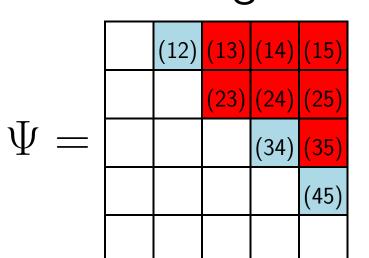

Catalan Functions

For $\gamma \in \mathbb{Z}^\ell$, $H(\Psi;\gamma) := \prod (1 - R_{ij})h_{\gamma}$

• Raising operators $R_{i,j}(h_{\lambda}) = h_{\lambda + \epsilon_i - \epsilon_j}$

$$R_{1,3}\left(\begin{array}{c} \\ \\ \\ \end{array}\right) = \begin{array}{c} \\ \\ \end{array}$$
 $R_{2,3}\left(\begin{array}{c} \\ \\ \end{array}\right) = \begin{array}{c} \\ \\ \end{array}$

• Root ideal Ψ : given by Dyck path.

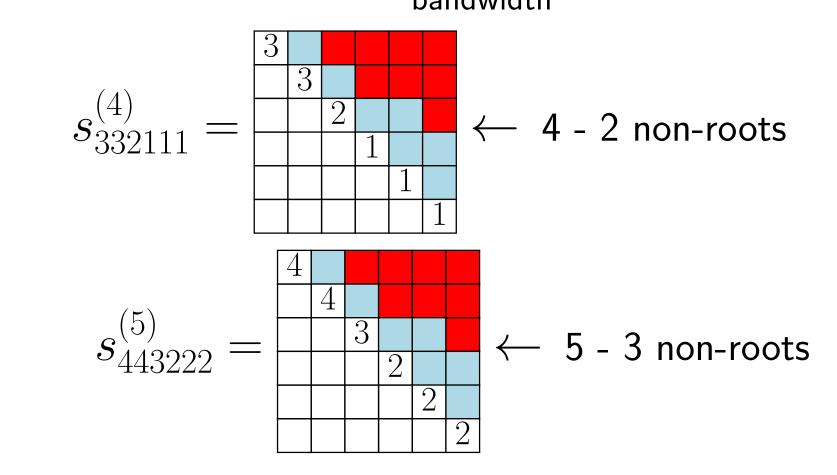

Roots above Dyck path Non-roots below

 $H(\Psi; 54332)$

- $= (1 R_{12})(1 R_{34})(1 R_{45})h_{54332}$
- $= h_{54332} h_{45332} h_{54422} h_{54341}$
- $+h_{45422}+h_{45341}+h_{54431}-h_{45431}$
- $H(\emptyset; \lambda) = s_{\lambda}$ (Jacobi-Trudi Identity)

k-Schur Catalans

 $s_{\lambda}^{(k)} = H(\Psi; \lambda)$ for particular Ψ , defined by $\lambda_i + \# \text{non-roots in row } i = k$.

Why use Catalan k-Schurs?

Shift Invariance:

$$e_\ell^\perp s_{\lambda+1^\ell}^{(k+1)} = s_\lambda^{(k)}$$

Corollary

Dual Pieri rule $\Longrightarrow s_{\lambda}^{(k)}$ branching!

$$s_{\lambda}^{(k)} = e_{\ell}^{\perp} s_{\lambda+1\ell}^{(k+1)} = \sum_{\mu} a_{\lambda\mu}^{(k)} s_{\mu}^{(k+1)}$$

where $a_{\lambda u}^{(k)}$ counts strong vertical strips.

K-theoretic Catalan Functions

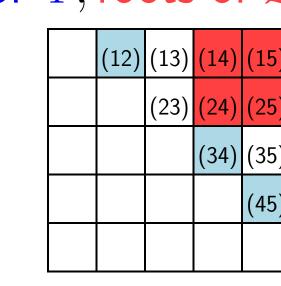

For $\gamma \in \mathbb{Z}^{\ell}$, root ideals Ψ, \mathcal{L} $K(\Psi; \mathcal{L}; \gamma) := \prod (1 - L_j) \prod (1 - R_{ij}) Kh_{\gamma}$

Lowering operators

$$L_j(Kh_{\lambda}) = Kh_{\lambda - \epsilon_j}$$

 $L_3\left(\begin{array}{c} \\ \\ \end{array}\right) = \begin{array}{c} \\ \\ \end{array}$

ullet non-roots of $\Psi,$ roots of ${\mathcal L}$

 $K(\Psi; \mathcal{L}; 54332)$ $= (1 - L_4)^2 (1 - L_5)^2$ $\cdot (1 - R_{12})(1 - R_{34})(1 - R_{45})Kh_{54332}$

• $K(\emptyset;\emptyset;\lambda)=g_{\lambda}$.

 $\mathfrak{g}_{\lambda}^{(k)} := K(\Psi; \mathcal{L}; \lambda) \text{ with } \mathrm{band}(\Psi) = k,$ $\operatorname{band}(\mathcal{L}) = k + 1$

Theorem: Shift Invariance

$$G_{1^\ell}^\perp \mathfrak{g}_{\lambda+1^\ell}^{(k+1)} = \mathfrak{g}_\lambda^{(k)}$$

Corollary

 $\mathfrak{g}_{\lambda}^{(k)}$ branching follows from dual Pieri rule.

Conjecture

$$\mathfrak{g}_{\lambda}^{(k)}=g_{\lambda}^{(k)}$$

Branching

• k-Schur functions are k+1-Schur positive: $s_{\lambda}^{(k)}=\sum a_{\lambda\mu}^{(k)}s_{\mu}^{(k+1)}$ with $a_{\lambda\mu}^{(k)}\in\mathbb{Z}_{\geq 0}$.

Open Problem

Describe the $G_{\lambda}^{(k)}$ Pieri rule. \iff Describe the $g_{\lambda}^{(k)}$ dual Pieri rule.

- Iteration gives Schur positivity of *k*-Schur functions.
- Conjecture: $g_{\lambda}^{(k)}$ is Schur positive.
- Conjecture: $g_{\lambda}^{(k)} = \sum_{\mu} (-1)^{|\lambda| |\mu|} b_{\lambda \mu}^{(k)} g_{\mu}^{(k+1)}$ for $b_{\lambda \mu}^{(k)} \in \mathbb{Z}_{\geq 0}$.
